

Question: A student says that if you throw a die, it will show up 1 or not 1. Therefore, the probability of getting 1 and the probability of getting 'not 1' each is equal to $\frac{1}{2}$. Is this correct? Give reasons.

Solution:

Let

$$p_X(k) = \begin{cases} \frac{1}{6}, & 1 \leq X \leq 6 \\ 0, & \text{otherwise} \end{cases} \quad (1)$$

$$\Pr(X \neq 1) = 1 - \Pr(X = 1) \quad (2)$$

$$= 1 - p_X(1) \quad (3)$$

$$= 1 - \frac{1}{6} \quad (4)$$

$$= \frac{5}{6} \quad (5)$$

$$\implies \Pr(X \neq 1) \neq \Pr(X = 1) \quad (6)$$

Since, $\Pr(X = 1)$ and $\Pr(X \neq 1)$ are not equal.

\therefore The given statement is not true.
